

SafeDocs

Towards a more secure future

Peter Wyatt
CTO, PDF Association & Principal Investigator, SafeDocs

SafeDocs

- *“The goal of the SafeDocs program is to dramatically improve software’s ability to detect and reject invalid or maliciously crafted input data, without impacting the key functionality of new and existing electronic data formats.*
- *SafeDocs seeks to create technological assurance that an electronic document or message is automatically checked and safe to open, while also generating safer document formats that are subsets of current, untrustworthy versions.”*

<https://www.darpa.mil/program/safe-documents>

Top 25 Most Dangerous Software Weaknesses

■ #4: Improper input validation

- #1: Out of bounds write
- #3: Out of bounds read

■ Score = prevalence and severity

Rank	ID	Name	Score	2020 Rank Change
[1]	CWE-787	Out-of-bounds Write	65.93	+1
[2]	CWE-79	Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting')	46.84	-1
[3]	CWE-125	Out-of-bounds Read	24.9	+1
[4]	CWE-20	Improper Input Validation	20.47	-1
[5]	CWE-78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	19.55	+5
[6]	CWE-89	Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')	19.54	0
[7]	CWE-416	Use After Free	16.83	+1
[8]	CWE-22	Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal')	14.69	+4
[9]	CWE-352	Cross-Site Request Forgery (CSRF)	14.46	0
[10]	CWE-434	Unrestricted Upload of File with Dangerous Type	8.45	+5
[11]	CWE-306	Missing Authentication for Critical Function	7.93	+13
[12]	CWE-190	Integer Overflow or Wraparound	7.12	-1
[13]	CWE-502	Deserialization of Untrusted Data	6.71	+8
[14]	CWE-287	Improper Authentication	6.58	0
[15]	CWE-476	NULL Pointer Dereference	6.54	-2
[16]	CWE-798	Use of Hard-coded Credentials	6.27	+4
[17]	CWE-119	Improper Restriction of Operations within the Bounds of a Memory Buffer	5.84	-12
[18]	CWE-862	Missing Authorization	5.47	+7
[19]	CWE-276	Incorrect Default Permissions	5.09	+22
[20]	CWE-200	Exposure of Sensitive Information to an Unauthorized Actor	4.74	-13
[21]	CWE-522	Insufficiently Protected Credentials	4.21	-3
[22]	CWE-732	Incorrect Permission Assignment for Critical Resource	4.2	-6
[23]	CWE-611	Improper Restriction of XML External Entity Reference	4.02	-4
[24]	CWE-918	Server-Side Request Forgery (SSRF)	3.78	+3
[25]	CWE-77	Improper Neutralization of Special Elements used in a Command ('Command Injection')	3.58	+6

Idiosyncrasies of the HTML parser

Simon Pieters

Parsing JSON is a Minefield

Session Description

JSON is the de facto standard when it comes to (un)serialising and exchanging data in web and mobile programming. But how well do you really know JSON? We'll read the specification and write test cases together. We'll test common JSON libraries against our test cases. I'll show that JSON is not as simple as it seems. We'll also find out how two libraries that exist in the wild can be maliciously crafted to cause a security issue. JSON libraries rely on loosely specified or non-existent features.

An Exploration of JSON Interoperability Vulnerabilities

 Jake Miller on Feb 25, 2021 5:00:00 AM

```
o = {  
  "qty": 1,  
  "qty": -1  
}  
o["qty"] // ???
```

TL;DR The same JSON document can be parsed with different values across microservices, leading to a variety of potential security risks. If you prefer a hands-on approach, [try the labs](#) and when they scare you, come back and read on.

PDF Compacted Syntax Matrix

Shows examples of valid PDF fragments (tokens/delimiter pair sequences) where whitespace is not required, according to ISO 32000-2:2020. Several sequences can only occur within arrays due to other PDF syntactic rules and limitations (e.g., all dictionary keys to be name objects and, in PDF 2.0, all keys must be direct objects). It is unclear how many sequences are artificial (i.e. never required by the PDF specification).

Curly braces { and } are not included in the matrix as they are a special case and only valid in PDF Type 4 PostScript function streams, when other tokens are also invalid (e.g. indirect references). This was a correction that was made in ISO 32000-2:2020.

	2 nd PDF object/token										
	A	B	C	D	E	F	G	H	I	J	K
1 st PDF object/token	Array	Boolean	Comment	Dictionary	Hex String	Indirect Ref	Integer	Literal String	Name	Null	Real

Microsoft EverParse / Project Everest

Project Everest Papers People In the News Related Projects

We are a [team of researchers and engineers](#) from several organizations, including [Microsoft Research](#), [Carnegie Mellon University](#), [INRIA](#), and the [MSR-INRIA joint center](#).

Provably Secure Communication Software

Focusing on the HTTPS ecosystem, including components such as the TLS protocol and its underlying cryptographic algorithms, Project Everest began in 2016 aiming to build and deploy formally verified implementations of several of these components in the [F* proof assistant](#).

While we have yet to complete a fully verified implementation of HTTPS, we have branched out to tackle a broader range of problems, including verified implementations of newer security protocols like [QUIC](#), [Signal](#) and [DICE](#), as well as securing networking infrastructure used in commercial cloud platforms.

Everest software is deployed in systems ranging from the Linux kernel and the Windows kernel to Microsoft Azure and Mozilla Firefox, improving the security and reliability of software used by *billions* of people every day.

Everest Artifacts with Formal Proofs

The following is a partial list of software components with formal proofs of correctness and security developed using Project Everest's toolchain.

The TLS-1.3 record Layer

The TLS record layer is the main bridge between applications and TLS' internal sub-protocols. Its core functionality is an elaborate authenticated encryption: streams of messages for each sub-protocol (hand- shake, alert, and application data) are fragmented, multiplexed, and encrypted with optional padding to hide their lengths

We have built and verified a reference implementation of the TLS record layer and its cryptographic algorithms in F*, reducing the high-level security of the record layer to cryptographic assumptions on its ciphers.
