

Open Data – PDF Beyond Final Form Visual Content

Dov Isaacs | Principal Scientist, Adobe | June 17, 2019

electronic
document

CONFERENCE

JUNE 17-18, 2019

The Challenge – Combating Ignorance & Misconceptions

PDFs are where data goes to die!

The Challenge – Combating Ignorance & Misconceptions

- **The “PDFs are where data goes to die” mantra is mindlessly echoed around the internet**
 - Great *clickbait* for attracting on-line attention
 - Most often parroted by persons with “issues” both real and imagined
 - Experienced difficulty in getting data requested, both in terms of availability and method of delivery
 - Undue attention to Tim Berners-Lee’s 5-star ranking system for Open Data in which he gives PDF 1 out of 5 stars
 - User confusion & “know it alls” who don’t
 - The PDF versus “Web Formats” bogeyman
 - Mistaken beliefs that PDF is a proprietary file format; Irrational hatred of PDF and/or Adobe

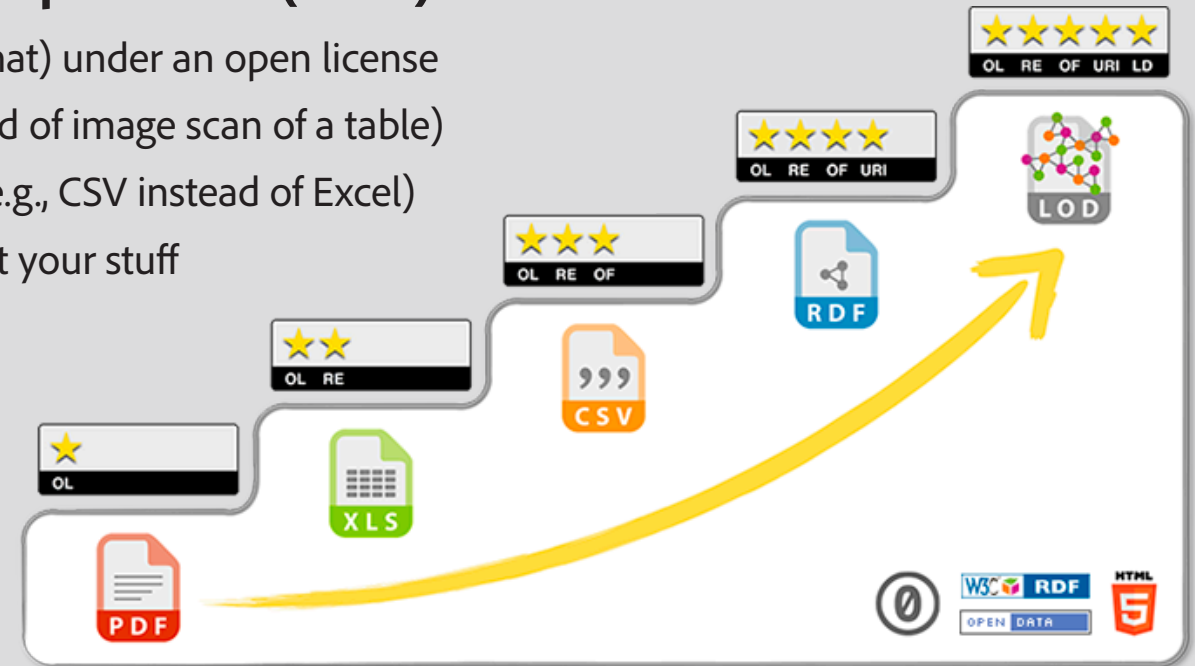

The Challenge – Combating Ignorance & Misconceptions

■ Tim Berners-Lee's 5-star ranking system for Open Data (2010)

- ★ Make your stuff available on the Web (whatever format) under an open license
- ★★ Make it available as structured data (e.g., Excel instead of image scan of a table)
- ★★★ Make it available in a non-proprietary open format (e.g., CSV instead of Excel)
- ★★★★ Use URIs to denote things, so that people can point at your stuff
- ★★★★★ Link your data to other data to provide context

- Ignores reality that PDF may indeed contain data files; it's not just for "scraping"
- Questionable value judgments; XLS may be more appropriate than CSV (hint: he hates Microsoft?)

- Our challenge is to tease apart the issues and provide data access solutions appropriate to one's needs

Open Data

- The concept of *Open Data* is that some data should be freely available to everyone to use and republish as they wish, without restrictions from copyright, patents or other mechanisms of control.
- Some contexts in which Open Data is of vital importance:
 - Functioning of governance in a free society;
laws supporting data access
(e.g., United States Freedom of Information Act and similar laws worldwide)
 - STEM Research;
access to full underlying data of experiments
is necessary for result validation and peer review
 - Finance;
certain financial data, especially of public companies
fits under the category of Open Data

Open Data

■ Issues

- Exactly which data qualifies as Open Data?
- Intentional delays in releasing data (i.e., roadblocks)
- Release of data in inappropriate formats requiring onerous and error-prone OCR, export, and “scraping” processes
 - Database or spreadsheet data output to a PDF file
 - Statistical data or even text as a PDF file created by scanning nth generation photocopies
 - Recipient needs “source document” and not “final form file format” for republishing content
- Recipient doesn't know how to use data provided
- Recipient wants / needs more than entitled to
- Dynamic access versus static, blind exchange archival access

The PDF versus “Web Formats” Bogeyman

- **Web Formats**
(HTML, CSS, Javascript, et.al.)
 - Potential to provide great *dynamic* access to data
 - Great for dashboard applications
 - Requires on-line access and availability of all assets
 - Results may vary by browser
(HTML & CSS are not standards,
much less ISO standards,
but rather, W3C “recommendations”)
 - May change underneath you!
 - Not archival!

The PDF versus “Web Formats” Bogeyman

■ PDF

- A “container” file format primarily used as a *final form file format* supporting compressed file attachments and metadata
- May be fully self-contained (“blind exchange”)
- Potential to provide great static access to data (doesn’t change and may be offline)
- International standards (not “recommendations”):
 - ISO 32000-1, PDF 1.7 & ISO 32000-1, PDF 2.0
 - ISO 19005, PDF/A (for archiving) subset standards

The PDF versus “Web Formats” Bogeyman

- **Hybrid Solutions
(Web Formats & PDF)**
 - Initial access of data-laden PDF file via the internet
 - Perfectly reasonable
 - Once you’ve downloaded the PDF file, you are totally self-sufficient
 - PDF file accesses external data via hyperlinks
 - Not recommended
 - Defeats the purpose of using PDF

Using PDF for (Open) Data

- **Available techniques and approaches**
 - Embedded files
 - Easier to implement
 - Independent of PDF viewer (no “context issues”); data extracted and operated on by program associated with particular file type
 - Metadata & Tagging
 - Generally requires more complex programming
 - Requires PDF viewer that is cognizant of particular metadata / tagging usage to access underlying data and pass on to program that should process that data

Using PDF for (Open) Data

- **Best practices for use of PDF for any data, much less Open Data:**
 - Use PDF/A-3 (PDF/A-4 when standard is available)
 - Embed data files using PDF/A-3 *associated files* feature in conjunction with *attachment annotations* (providing direct access to data from within PDF graphical content)
 - Use “standard formats” for embedded data files wherever possible or practical
 - Do not embed “executable” files
 - Check files for viruses and exploits *prior* to embedding
 - Do not use hyperlinks to reference data external to the PDF file
 - Digitally sign PDF file to assure no modifications are made

A Simple Example – ZUGFeRD

- Specification and implementation rules for the cross-industry core invoice format of the Forum for Electronic Invoicing in Germany (FeRD - Forum elektronische Rechnung Deutschland)
- Combines a Visual Representation (ISO 19005-3-2012 PDF/A-3) with an XML-based Structured Representation (ISO 15000-5:2014, the UN/CEFACT Cross Industry Invoice [CII] Standard plus the European Core Invoice Data Model MUG) of the invoice
- ZUGFeRD 2.0 specification recently released

The ZUGFeRD Format

Specification and implementation rules for the cross-industry core invoice format of the Forum for Electronic Invoicing in Germany (FeRD – Forum elektronische Rechnung Deutschland)

Version 1.0

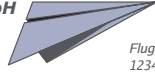

ZUGFeRD 1.0 German Specification: 25th June 2014;
ZUGFeRD 1.0 English Translation: 1st January 2015

A Simple Example – ZUGFeRD

- **PDF/A-3 is the format used for ZUGFeRD**
 - It is able to meet all the requirements made of an electronic invoice in a single file.
 - It is able to embed all data used for automated further processing.
 - Invoicees who do not carry out any automatic further processing are not irritated by additional files.
 - PDF is already the most widely used data format for exchanging documents. (Invoices can be viewed using the free tools which come preinstalled on virtually all PCs, smart phones and other end devices.)
 - PDF/A ensures that an invoice file can be viewed permanently in a form that remains identical.
- **Other supporting documents/data may also be attached**
- **1 PDF/A-3 file = 1 invoice**

A Simple Example – ZUGFeRD

- A sample ZUGFeRD File:

Consumer Utility Statements

Pacific Gas & Electric Company (PG&E)

- **Customers receive monthly printed statements.**

The envelope also includes advertisements and regulatory information (notices of rate increases usually) on separate sheets plus a return envelope.

- **PDF copy of the statement**

This may be downloaded by customer from the company's website for a limited period of time.

- **The statement contains current billing information plus some limited historical information in graphical form.**

- **If you know where to look**

You can also download historical data associated with your account and other useful information from *elsewhere* on the PG&E website!

Page 5 of 6

Consumer Utility Statements

■ Stage 1 Fixups:

- Downloaded all the “goodies” from the PG&E website
- Simply attach these files to the base PDF file?
Don't waste your time! Not very useful!
- Embedded the downloaded files via *attachment annotations* at appropriate locations within the statement's PDF file
- Create a PDF/A-3b file via Acrobat Pro DC Preflight profile *Convert to PDF/A-3b (without fallback conversion)*

Consumer Utility Statements

- Stage 2 Fixups:
 - Add explanatory text to indicate what those paper clips signify!
 - Save file after validating that the file still conforms to PDF/A-3b
 - Digitally sign and lock file
 - Again, validate PDF/A-3b conformance

Page 4 of 6

Consumer Utility Statements

- All this can readily be done with current tools and standards
- There is no good reason why these techniques cannot and should not be utilized by utilities and other vendors *now*
 - More secure
 - Lower cost of customer support (especially if receipts attached)
- In the future, such files may concurrently be tagged as complying with *both* PDF/A-4 (for *archiving*) and PDF/X-6 (for *printing*)

STEM Document Equations

... It started off as an innocuous e-mail from an RIT graphic arts professor who passed along a request to me from an RIT computer science professor querying about heuristics for recognizing and extracting equations from an existing PDF file ...

- **Demonstrated need to be able to extract equations (mathematical expressions) from PDF files for repurposing including indexing, experimentation, etc.**
- **Scraping is particularly difficult given the many methods of representing the “final form” of mathematical expressions**
 - Text, vector, raster, or combinations of same
 - Symbols synthesized with multiple glyphs
 - Non-standard font encodings
 - Interesting spacing and scaling considerations

STEM Document Equations

- **Better to create PDF with data embedded representing these equations**
- **But what and how?**
 - Attached file
 - Each equation's representation is relatively small
 - Potentially very many such objects in a document
 - Metadata
 - Requires PDF viewer that is equation metadata-aware

STEM Document Equations

- **Competing formats**
 - MathML - another W3C recommendation
 - TeX - a favorite of mathematicians using TeX for layout
 - Proprietary formats (Word, MathType, etc.)
 - Multiple files or a file with multiple formats for each equation
- **Presentation versus Context;
MathML provides both forms**
- **Can we get a consensus?**
 - What is really needed and actually useful?
 - What format(s) should be used?

STEM Document Equations

- **Example using similar techniques utilized with PG&E statement**
 - Microsoft Word document with MathType-style equations
 - Created PDF file via Acrobat PDFMaker (including source file)
 - Embedded the files representing multiple formats available for equations (copied from MathType editor) via attachment annotations at appropriate locations within the document's PDF file
 - TeX
 - MathML 2.0
(both "m namespace" and "namespace attr" variants)
 - Manually attached .EPS files saved from MathType for equations 1 and 5
 - Created a PDF/A-3b file via Acrobat Pro DC Preflight profile *Convert to PDF/A-3b (without fallback conversion)*

STEM Document Equations

Equations

(CLEAR instructor: Dynette Reynolds)
dynette.reynolds@utah.edu

Abstract—This handout describes the IEEE guidelines for formatting equations and mathematical symbols. It also tells you how to add Microsoft Word’s “Equation Editor” to your toolbar.

I. FORMATTING EQUATIONS

Equations in a scientific paper should be visibly differentiated from the rest of the text. Set the equation off from the text by inserting a blank line both above and below the equation, which is usually centered on the line. Number each equation consecutively with equation numbers in parentheses flush with the right margin, as in (1) below.

$$\hat{\sigma}_z^2 = \frac{1}{m-1} (2I_x^T L_{z,0}^T L_{z,0} - I_x^T L_{z,0}^T L_{z,0} L_{z,0}^T I_x - I_{z,0}) \quad (1)$$

$$a + b = c$$

To create a single line of text with different alignments, as in (1) above, create your equation using the equation editor (see section IV below). Then center the equation box. Place your cursor outside the box and to the right of it. Then right-justify the equation number by tabbing over to the right margin.

If the equation is too long for one line, it may be broken up into two or more lines, and the labeling number may be placed one line below (but still flush right). In this case, the first part of the equation is indented from the left, with each subsequent part tabbed further right:

$$L(x_i, d_i, \lambda_i) = U(x_i) + \lambda_i(1 - l_i(x_i, d_i)) + E_{m+1} | x_i, d_i \{ \max L_{k+1}(x_{k+1}) \} \quad (2)$$

II. EXPLAINING EQUATIONS

Equations must be introduced before inserting them in your text. You might do this by explaining the purpose of the equation or what type of equation it is. Remember also to define the symbols you are using either before the equation or immediately following. After inserting the

equation in the text, it is often appropriate to discuss important aspects or specific elements of the equation. Refer to the equation simply as (1), not “Eq. (1)” or “equation (1),” unless you are beginning a sentence with “Equation (1) is...”

- *Example:* The kinematic states evolve dynamically according to a linear state space model (3):

$$\dot{\xi}(t + t) = F(T)\xi(t) + w_i(T) \quad (3)$$

where F(T) is the state transition matrix of the target state model, and w_i(T) is the driving maneuver input.

III. IEEE RULES FOR MATHEMATICAL NOTATION

Symbols that look like each other are not interchangeable with each other. Authors must distinguish clearly between the following terms:

- Capital and lowercase letters, when used as symbols
- Zero and the letter “O”
- Lowercase letter “l,” numeral one (1), and the prime sign (p)
- The letters “k” and σ (kappa), “u” and μ (mu), “v” and ν (nu), and “n” and θ (eta)

Also, brackets must be used carefully and in the proper order: **{[()]}**

Remember that your equation is part of the explanatory sentence that precedes it in your text. If your equation appears at the end of a sentence, you should place a period there. No other punctuation is permitted at the end of an equation. In the middle of an equation, or between an equation and its condition, other punctuation symbols, such as commas, are permitted.

IV. USING MATHEMATICAL SYMBOLS IN MICROSOFT WORD

There are several ways to insert mathematical symbols while working in Microsoft Word. The easiest way is to click “Insert” on the toolbar, then “Symbol.” Scroll through the “Fonts” choices to find symbol sets like Arial Unicode, WP Greek Century, or WP Math. A set of pre-designed symbols will appear. Click on the symbol you want, then on “Insert” and “Close.” The symbol will appear in your text. (You may have to italicize or bold these symbols.)

A second way is to use Microsoft’s “Equations Editor,” which may or may not already be on your computer. To figure out whether you have this feature, type “Insert an equation” into the Word Help Search box. Follow the directions. If “Equation Editor” does not appear on the designated menu, you must install it from your original disk. Instructions for this may be found by typing “Troubleshoot Equation Editor” into the Word Help Search box.

Once you have the Equation Editor on your computer, you could add a shortcut to your toolbar so that you don’t have to go through the “Insert” menu every time. To add the shortcut, click on the “View” menu, then on “Toolbars.” At the bottom of the toolbars list, select

“Customize.” On that menu, select “Commands.” In the Categories box on the left, select “Insert.” In the Commands box on the right, scroll down until you find “Equations Editor.” Click on that and drag it up to your toolbar. An icon should appear in your toolbar. Close the “Customize” box.

When you click on the shortcut icon, the Equation Editor will create a special equation box at any point in your text. A special toolbar will also appear on your screen. Use the toolbar to select symbols, brackets, etc. to place in the box. You may also type numbers and letters into this box. At the top of the screen, a simplified toolbar lets you select font size (including subscript and sub-subscript), style, and alignment.

Other Samples:

$$\int_0^{\infty} F(r, \varphi) dr d\varphi = [\sigma r_z / (2\mu_0)] \cdot \int_0^{\infty} \exp(-\lambda |z_j - z_i|) \lambda^{-1} J_1(\lambda r_z) J_0(\lambda r_r) d\lambda$$

$$\hat{\sigma}_z^2 = \frac{1}{m-1} (2I_x^T L_{z,0}^T L_{z,0} - I_x^T L_{z,0}^T L_{z,0} L_{z,0}^T I_x - I_{z,0}) \quad (5)$$

$$p(s) = \frac{m}{\eta} \left(\frac{s}{\eta}\right)^{m-1} \exp\left[-\left(\frac{s}{\eta}\right)^m\right] \quad (6)$$

Summary

- PDF offers excellent opportunities and features to contain, represent, and deliver final form not only visual content, but also underlying data in readily-accessible usable / processable formats
- PDF open data solutions are available *now*!
- PDF is absolutely *not* where data goes to die!
